2. Since the age of our target users ranges from the 20s to over 60s, we tried to make our application simple, straightforward, and friendly to use. Instead of strong and vivid colors, such as red or yellow, or serious and dark colors, such as black or brown, we chose light blue to give a soft feeling. In terms of fonts, we chose a cute and simple one. We also tried our best to make overall layouts as simple as possible so that users won't have a hard time reading through content.

3. Mostly, we used our friendship to recruit participants. Demographics vary from the early-20s to mid-20s. Key findings are continued below.

4.
   We meant to have a cancel button to cancel the reservation if users reserved laundry machines accidentally or reserved a different one. However, when we were testing the potential users, they were confused with the cancel button that was placed next to the Go back button after completing the reservation. Second, an observation that we found interesting was that we wanted to divide the sections as primary features for the weekly reminder and alarm setting for a finish of laundry. However, when it came to user testing, they were unclear about setting two kinds of reminders in different sections. We thought they are different settings for users, but they did not catch the meaning and they gave us feedback to have two kinds of reminders in the same section so that users can select their settings fast and intuitively. Third, in the weekly reminder feature, users tried to select the time first instead of the leftmost option (day). Therefore, we gave the restriction that will make the user select the day first by hiding the options that should not be selected.

5. - Clarification of the "Cancel button" in the reservation system.
   - Clarification of alarm setting and the weekly reminder that made the user confused.
   - Giving restriction in the "Weekly Reminder" system to select in left to right order. (Day - Time - How)

6. From the in-class review, we had a few useful feedback to revise. The alarm setting page lacked a description, so users had a hard time figuring out what to do on that page. Also, users suggested putting alarm settings and weekly reminders together on one page.
